

Anti-skid Rumble Strips

GT-Roadtech's Anti-skid Rumble Strips are based on *Degaroute* © highly durable MMA resins. The rumble strip system incorporates:

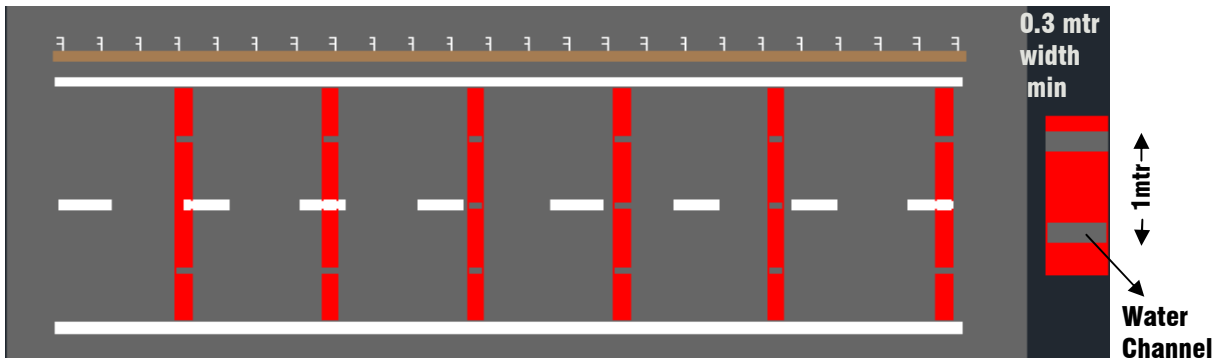

- High anti-skid values from embedded anti-skid materials to ensure braking vehicles' safety.
- Water channeling design to reduce aquaplaning/hydroplaning.
- Visual warning from the coloured surface.

This system addresses all the weaknesses that thermoplastic systems fails to address.

The rumble strip system is made up of 3 coatings. A base coat, an anti-skid layer and, a top coat to seal the entire system to ensure durability.

The entire system is fully trafficable within 45 minutes after application. This means there will be minimal disruption to the traffic, but there'll be maximum impact on road users' safety.

Bar quantity and the distance between bars are varies to suit the total length of the surface to be marked and subject to approval by engineer.
